Raw data used

The raw data used consists of a limited dataset of 26 samples, 13 “schudproeven” (SP) and 13 “kolomproeven” (KP). Data is lifted from Table 10 (p.22 and 23) of memo OWV7-ATL-NOT-013.

Summary statistics full dataset

Note the inconsistencies with values reported in the original memo where the mean “gidsparameter” value is set to be 152.08 rather than 179.85.

Summary statistic	Uitloging (μg/l)	Concentratie gidsparameter (μg/kg ds)
mean	13.61	179.85
median	4.35	85.00
min	0.22	10.00
max	57.00	551.00

Summary statistics limited dataset

The limited dataset consists of all samples with "uitloging" concentrations of less than 10μg/l.

Summary statistic	Uitloging (μg/l)	Concentratie gidsparameter (μg/kg ds)
mean	2.64	96.24
median	1.20	21.00
min	0.22	10.00
max	9.20	490.00

Empirical model fits as calculated

Data were fit using an exponential and power curve, on both SP and KP groups separately or combined. Assuming processing using a spreadsheet linearized (log transformed) data was used to estimate parameters a and b for both functional forms.

Schudproef / Kolomproef (or combined)	set (limited <10 μg/l uitloging)	a	b	R2	functional form

Differences in model fits

Differences in parameters between recalculated fits and reported values are minimal, can be attributed to rounding errors and small mis-reporting of values.
